Is your laptop battery always running low?

A few tips to improve battery life on your laptop:

• Close unused apps and tabs.
  o More programs running = more energy used.

• At school and not using your laptop? Put it to sleep.
  o Be aware that it might be slow to wake up and may lead to needing to re-connect Wi-Fi.

• No games, just schoolwork on your school device.
  o Games and social apps drain batteries the fastest.

• Adjust screen brightness.
  o Less brightness = less power used.

• Shut your computer down every night.
  o Computers need rest too.

• Don’t drain your battery down to 0% before charging.
  o Draining only to 50% and charging can improve battery life.

• Restart at least once a day.
  o This clears power-draining memory hang-ups.

• Adjust the power mode to “best battery life.”
  o However, it will decrease performance.
